(54) Title: **THE C. ELEGANS GRO-1 GENE**

(57) Abstract

The invention relates to the identification of *gro-1* gene and to demonstrate that the *gro-1* gene is involved in the control of a central physiological clock. Also disclosed are four other genes located within the same operon as the *gro-1* gene.

THE C. ELEGANS GRO-1 GENE

BACKGROUND OF THE INVENTION(a) Field of the Invention

The invention relates to the identification of
5 *gro-1* gene and four other genes located within the same
operon and to show that the *gro-1* gene is involved in
the control of a central physiological clock.

(b) Description of Prior Art

The *gro-1* gene was originally defined by a
10 spontaneous mutation isolated from of a *Caenorhabditis*
elegans strain that had recently been established from
a wild isolate (J. Hodgkin and T. Doniach, *Genetics*
146: 149-164 (1997)). We have shown that the activity
of the *gro-1* gene controls how fast the worms live and
15 how soon they die. The time taken to progress through
embryonic and post-embryonic development, as well as
the life span of *gro-1* mutants is increased (Lakowski
and Hekimi, *Science* 272:1010-1013, (1996)). Further-
more, these defects are maternally rescuable: when
20 homozygous mutants (*gro-1/gro-1*) derive from a
heterozygous mother (*gro-1/+*), these animals appear to
be phenotypically wild-type. The defects are seen only
when homozygous mutants derive from a homozygous mother
(Lakowski and Hekimi, *Science* 272:1010-1013, (1996)).
25 In general, the properties of the *gro-1* gene are simi-
lar to those of three other genes, *clk-1*, *clk-2* and
clk-3 (Wong et al., *Genetics* 139: 1247-1259 (1995);
Hekimi et al., *Genetics*, 141: 1351-1367 (1995);
Lakowski and Hekimi, *Science* 272:1010-1013, (1996)),
30 and this combination of phenotypes has been called the
Clk ("clock") phenotype. All four of these genes
interact to determine developmental rate and longevity
in the nematode. Detailed examination of the *clk-1*
mutant phenotype has led to the suggestion that there
35 exists a central physiological clock which coordinates

all or many aspects of cellular physiology, from cell division and growth to aging. All four genes have a similar phenotype and thus appear to impinge on this physiological clock.

5 It would be highly desirable to be provided with the molecular identity of the *gro-1* gene.

SUMMARY OF THE INVENTION

10 One aim of the present invention is to provide the molecular identity of the *gro-1* gene and four other genes located within the same operon.

15 In accordance with the present invention there is provided a *gro-1* gene which has a function at the level of cellular physiology involved in developmental rate and longevity, wherein *gro-1* is located within an operon and *gro-1* mutants have a longer life and a altered cellular metabolism relative to the wild-type.

20 In accordance with a preferred embodiment, the *gro-1* gene of the present invention codes for a GRO-1 protein having the amino acid sequence set forth in Figs. 3A-3B (SEQ ID. NO:2).

25 The *gro-1* gene is located within an operon which has the nucleotide sequence set forth in SEQ ID NO:1 and which also codes for four other genes, referred as *gop-1*, *gop-2*, *gop-3* and *hap-1* genes.

30 In accordance with a preferred embodiment, the *gop-1* gene of the present invention codes for a GOP-1 protein having the amino acid sequence set forth in Figs. 13A-13C (SEQ ID. NO:4).

35 In accordance with a preferred embodiment, the *gop-2* gene of the present invention codes for a GOP-2 protein having the amino acid sequence set forth in Fig. 14 (SEQ ID. NO:5).

 In accordance with a preferred embodiment, the *gop-3* gene of the present invention codes for a GOP-3

protein having the amino acid sequence set forth in Figs. 15A-15B (SEQ ID. NO:6).

In accordance with a preferred embodiment, the *hap-1* gene of the present invention codes for a HAP-1
5 protein having the amino acid sequence set forth in Fig. 16 (SEQ ID. NO:7).

In accordance with a preferred embodiment of the present invention, the *gro-1* gene is of human origin and has the nucleotide sequence set forth in Fig. 8
10 (SEQ ID. NO:3).

In accordance with a preferred embodiment of the present invention, there is provided a mutant GRO-1 protein which has the amino acid sequence set forth in Fig. 3C.

15 In accordance with the present invention there is also provided a GRO-1 protein which has a function at the level of cellular physiology involved in developmental rate and longevity, wherein said GRO-1 protein is encoded by the *gro-1* gene identified above.

20 In accordance with a preferred embodiment of the present invention, there is provided a GRO-1 protein which has the amino acid sequence set forth in Figs. 3A-3B (SEQ ID. NO:2).

In accordance with a preferred embodiment of the present invention, there is provided a GOP-1 protein which has the amino acid sequence set forth in Figs. 13A-13C (SEQ ID. NO:4).

25 In accordance with a preferred embodiment of the present invention, there is provided a GOP-2 protein which has the amino acid sequence set forth in Fig. 14 (SEQ ID. NO:5).

In accordance with a preferred embodiment of the present invention, there is provided a GOP-3 protein which has the amino acid sequence set forth in Figs.
30 15A-15B (SEQ ID. NO:6).

In accordance with a preferred embodiment of the present invention, there is provided a HAP-1 protein which has the amino acid sequence set forth in Fig. 16 (SEQ ID. NO:7).

5 In accordance with the present invention there is also provided a method for the diagnosis and/or prognosis of cancer in a patient, which comprises the steps of:

- a) obtaining a tissue sample from said patient;
- 10 b) analyzing DNA of the obtained tissue sample of step a) to determine if the human *gro-1* gene is altered, wherein alteration of the human *gro-1* gene is indicative of cancer.

15 In accordance with the present invention there is also provided a mouse model of aging and cancer, which comprises a gene knock-out of murine gene homologous to *gro-1*.

20 In accordance with the present invention there is provided the use of compounds interfering with enzymatic activity of GRO-1, GOP-1, GOP-2, GOP-3 or HAP-1 for enhancing longevity of a host.

25 In accordance with the present invention there is provided the use of compounds interfering with enzymatic activity of GRO-1, GOP-1, GOP-2, GOP-3 or HAP-1 for inhibiting tumorous growth.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1A illustrates the genetic mapping of *gro-1*;

30 Fig. 1B illustrates the physical map of the *gro-1* region;

Fig. 2A illustrates cosmid clones able to rescue the *gro-1* (e2400) mutant phenotype;

35 Fig. 2B illustrates the genes predicted by Genefinder, the relevant restriction sites and the fragments used to subclone the region;

Figs. 3A-3B illustrate the genomic sequence and translation of the *C. elegans gro-1* gene (SEQ. ID. NO:2);

Fig. 3C illustrates the predicted mutant protein;

Figs. 15A-15B illustrate the genomic sequence and translation of the *gop-3* gene (SEQ. ID. NO:6); and

Fig. 16 illustrates the genomic sequence and translation of the *hap-1* gene (SEQ. ID. NO:7).

DETAILED DESCRIPTION OF THE INVENTION

5

The *gro-1* phenotype

In addition to the previously documented phenotypes, we recently found that *gro-1* mutants were temperature-sensitive for fertility. At 25°C the progeny
10 of these mutants is reduced so much that a viable strain cannot be propagated. In contrast, *gro-1* strains can easily be propagated at 15 and 20°C.

We also discovered that the *gro-1(e2400)* mutation increases the incidence of spontaneous mutations.
15 As *gro-1(e2400)* was originally identified in a non-standard background (Hodgkin and Doniach, *Genetics* **146**: 149-164 (1997)), we first backcrossed the mutations 8 times against N2, the standard wild type strain. We then undertook to examine the *gro-1* strain and N2 for
20 the occurrence of spontaneous mutants which could be identified visually. We focused on the two class of mutants which are detected the most easily by simple visual inspection, uncoordinated mutants (Unc) and dumpy mutants (Dpy). We examined 8200 wild type worms
25 and found no spontaneous visible mutant. By contrast, we found 6 spontaneous mutants among 12500 *gro-1* mutants examined. All mutants produced entirely mutant progeny indicating that they were homozygous.

Positional cloning of *gro-1*

gro-1 lies on linkage group III, very close to the gene *clk-1*. To genetically order *gro-1* with respect to *clk-1* on the genetic map, 54 recombinants in the *dpy-17* to *lon-1* interval were selected from among the self progeny of a strain which was *unc-79(e1030) + + clk-1(e2519) lon-1(e678) +/- dpy-17(e164) gro-1(e2400) + sma-4(e729)*. Three of these showed neither the Gro-1 nor the Clk-1 phenotypes, but carried *unc-79*

and *sma-4*, indicating that these recombination events had occurred between *gro-1* and *clk-1*. From the disposition of the markers, this showed that the gene order was *dpy-17 gro-1 clk-1 lon-1*, and the frequency of events indicated that the *gro-1* to *clk-1* distance was 0.03 map units. In this region of the genome, this corresponds to a physical map distance of ~20 kb.

Several cosmids containing wild-type DNA spanning this region of the genome were tested by microinjection into *gro-1* mutants for their ability to complement the *gro-1(e2400)* mutation (Fig. 1). *gro-1* was mapped between *dpy-17* and *lon-1* on the third chromosome, 0.03 m.u. to the left of *clk-1* (Fig. 1A).

Based on the above genetic mapping, *gro-1* was estimated to be approximately 20 kb to the left of *clk-1*. Eight cosmids (represented by medium bold lines) were selected as candidates for transformation rescue (Fig. 1B). Those which were capable of rescuing the *gro-1(e2400)* mutant phenotype are represented as heavy bold lines (Fig. 1B).

Of these, only B0498, C34E10 and ZC395 were able to rescue the mutant phenotype. Transgenic animals were fully rescued for developmental speed. In addition, the transgenic DNA was able to recapitulate the maternal rescue seen with the wild-type gene, that is, mutants not carrying the transgenic DNA but derived from transgenic mothers display a wild type phenotype. The 7 kb region common to the three rescuing cosmids had been completely sequenced, and this sequence was publicly available.

We generated subclones of ZC395 and assayed them for rescue (Fig. 2). The common 6.5 kb region is blown up in part B. B0498 has not been sequenced and therefore its ends can not be positioned and are therefore represented by arrows.

One subclone pMQ2, spanned 3.9 kb and was also able to completely rescue the growth rate defect and recapitulate the maternal effect. The sequences in pMQ2 potentially encodes two genes. However, a second
5 subclone, pMQ3, which contained only the first of the potential genes (named ZC395.7 in Fig. 2A), was unable to rescue.

Furthermore, frameshifts which would disrupt each of the two genes' coding sequences were constructed in pMQ2 and tested for rescue. Disruption of
10 the first gene (in pMQ4) did not eliminate rescuing ability, but disruption of the second gene (in pMQ5) did. This indicates that the *gro-1* rescuing activity is provided by the second predicted gene.

pMQ2 was generated by deleting a 29.9 kb *SpeI* fragment from ZC395, leaving the left-most 3.9 kb region containing the predicted genes ZC395.7 and ZC395.6 (Fig. 2B). pMQ3 was created in the same fashion, by deleting a 31.4 kb *NdeI* fragment from ZC395,
20 leaving only ZC395.7 intact. In pMQ4, a frameshift was induced in ZC395.7 by degrading the 4 bp overhang of the *ApaI* site. A frameshift was also induced in pMQ5 by filling in the 2 bp overhang of the *NdeI* site found in the second exon of ZC395.6. These frameshifts presumably abolish any function of ZC395.7 and ZC395.6
25 respectively. The dotted lines represent the extent of frameshift that resulted from these alterations.

To establish the splicing pattern of this gene, cDNAs encompassing the 5' and 3' halves of the gene
30 were produced by reverse transcription-PCR and sequenced (Fig. 3).

This revealed that the gene is composed of 9 exons, spans ~2 kb, and produces an mRNA of 1.3 kb. To confirm that this is indeed the *gro-1* gene, genomic DNA
35 was amplified by PCR from a strain containing the *gro-*

1(e2400) mutation and the amplified product was sequenced. A lesion was found in the 5th exon, where a 9 base-pair sequence has been replaced by a 2 base-pair insertion, leading to a frameshift (Fig. 3C). Fig. 3C illustrates those residues which differ from wild type are in bold.

The reading frame continues out-of-frame for another 33 residues before terminating.

Figs. 3A-B illustrate the coding sequence in capital letters, while the introns, and the untranslated and intergenic sequence are in lower case letters. The protein sequence is shown underneath the coding sequence. Position 1 of the nucleotide sequence is the first base after the SL2 trans-splice acceptor sequence. Position 1 of the protein sequence is the initiator methionine. All PCR primers used for genomic and cDNA amplification are represented by arrows. For primers extending downstream (arrows pointing right) the primer sequence corresponds exactly to the nucleotides over which the arrow extends. But for primers extending upstream (arrows pointing left) the primer sequence is actually the complement of the sequence under the arrow. In both cases the arrow head is at the 3' end of the primer. The sequence of the two primers which flank *gro-1* (SHP93 and SHP92) are not represented in this figure. Their sequences are: SHP93 TTTCTGGATTTTAACCTTCC (SEQ. ID. NO:10) and SHP92 GATAGTTCCTTCGTTCTGGG (SEQ. ID. NO:9). The wild type splicing pattern was determined by sequencing of the cDNA. Identification of the e2400 lesion was accomplished by sequencing the e2400 allele. The e2400 lesion consists of a 9 bp deletion and a 2 bp insertion at position 1196, resulting in a frameshift.

gro-1 is part of a complex operon (Figs. 3A-3B)

Amplification of the 5' end of *gro-1* from cDNA occurred only when the *trans*-spliced leader SL2 was used as the 5' primer, and not when SL1 was used. SL2 is used for *trans*-splicing to the downstream gene when two genes are organized into an operon (Spieth et al., *Cell* 73: 521-532 (1993); Zorio et al., *Nature* 372: 270-272 (1994)). This indicates that at least one gene upstream of *gro-1* is co-transcribed with *gro-1* from a common promoter. We found that sequences from the 5' end of the three next predicted genes upstream of *gro-1* (ZC395.7, C34E10.1, and C34E10.2) all could only be amplified with SL2. Sequences from the fourth predicted upstream gene (C34E10.3), however, could be amplified with neither spliced leader, suggesting that it is not *trans*-spliced. The distance between genes in operons appear to have an upper limit (Spieth et al., *Cell* 73: 521-532 (1993); Zorio et al., *Nature* 372: 270-272 (1994)), and no gene is predicted to be close enough upstream of C34E10.3 or downstream of *gro-1* to be co-transcribed with these genes. Our findings suggest therefore that *gro-1* is the last gene in an operon of five co-transcribed genes (Fig. 4).

Nested PCR was used to amplify the 5' end of each gene. SL1 or SL2 specific primers were used in conjunction with a pair of gene-specific primers. cDNA generated by RT-PCR using mixed stage N2 RNA was used as template in the nested PCR. Fig. 4A illustrates a schematic of the *gro-1* operon showing the coding sequences of each gene and the primers (represented by flags) used to establish the *trans*-splicing patterns.

Fig. 4B illustrates the products of the PCR with SL1 and SL2 specific primers for each of the five genes. The sequences of the primers used are as follows: SL1: TTTAATTACCCAAGTTTGAG (SEQ. ID. NO:61), SL2:

TTTTAACCCAGTTACTCAAG (SEQ. ID. NO:62), SHP141:
 AAAACTTCTACCAACAATGG (SEQ. ID. NO:30), SHP142:
 CGTAATCTCTCTCGATTAGC (SEQ. ID. NO:31), SHP143:
 CCGTGGGATGGCTACTTGCC (SEQ. ID. NO:32), SHP144:
 5 TGGATTTGTGGCAGGACGCGG (SEQ. ID. NO:33), SHP145:
 TTGATTGCCTCTCCTCGTCC (SEQ. ID. NO:34), SHP146:
 ATCAACATCTGATTGATTCC (SEQ. ID. NO:35), SHP130:
 CATCCAAAAGCAGTATCACC (SEQ. ID. NO:24), SHP119:
 ACATCTTTATCCATTTCTCC (SEQ. ID. NO:21), SHP95:
 10 TACAGGAATTTTTGAACGGG (SEQ. ID. NO:12), SHP99:
 ATCGATACCACCGTCTCTGG (SEQ. ID. NO:16).

The gene immediately upstream of *gro-1*, has
 homology to the yeast gene *HAM1*, and we have renamed
 the gene *hap-1*. We have established its splicing pat-
 15 tern by reverse transcription PCR and sequencing. This
 revealed that *hap-1* is composed of 5 exons and produces
 an mRNA of 0.9 kb. We also found that sequences which
 were predicted to belong to ZC395.7 (now *hap-1*) are in
 fact spliced to the exons of C34E10.1. This is consis-
 20 tent with our finding that *hap-1* is SL2 spliced as it
 puts the end of the C34E10.1 very close to the start of
hap-1 (Fig. 4).

The *gro-1* gene product

Conceptual translation of the *gro-1* transcript
 25 indicated that it encodes a protein of 430 amino acids
 highly similar to a strongly conserved cellular enzyme:
 dimethylallyldiphosphate:tRNA dimethylallyltransferase
 (DMAPP transferase). Fig. 5 shows an alignment of *gro-1*
 with the published sequences of the *E. coli* (P16384)
 30 and yeast (P07884) enzymes. Residues where the
 biochemical character of the amino acids is conserved
 are shown in bold. Identical amino acids are indicated
 further with a dot. The ATP/GTP binding site and the
 C2H2 zinc finger site are predicted and not
 35 experimental. The point at which the *gro-1*(e2400)

mutation alters the reading frame of the sequence is shown. The two alternative initiator methionines in the yeast sequence, and the putative corresponding methionines in the worm sequence, are underlined.

5 Database searches also identified a homologous human expressed sequence tag (Genbank ID: Z40724). The human clone has been used to derive a sequence tagged site (STS). This means that the genetic and physical position of the human *gro-1* homologue is known. It maps to chromosome 1, 122.8 cR from the top of Chr 1 linkage group and between the markers D1S255 and D1S2861. This information was found in the UniGene database or the National Center for Biotechnology Information (NCBI). We have sequenced Z40724 by classical methods but found that Z40724 is not a full length cDNA clone as it does not contain an initiator methionine nor the poly A tail. We used the sequence of Z40724 to identify further clones by database searches. We found one clone (Genbank ID: AA332152) which extended the sequence 5' by 28 nucleotides, as well as one clone (Genbank ID: AA121465) which extended the sequence substantially in the 3' direction but didn't include the poly A tail. We then used AA121465 to identify an additional clone (AA847885) extending the sequence to the poly A tail. Fig. 8 shows the full sequence with the putative initiator ATG shown in bold and the sequence of Z60724 is shown underlined. A comparison of the conceptual amino acid sequences for GRO-1 and hgro-1p is shown in Fig. 9. Amino acid identities are indicated by a dot. Both sequences contain a region with a zinc finger motif which is shown underlined.

An additional metazoan homologue is represented by Drosophila EST: Genbank accession: AA816785. In *E. coli* and other bacteria, the gene encoding DMAPP trans-

ferase is called *miaA* (a.k.a *trpX*) and is called *mod5* in yeast. DMAPP transferase catalyzes the modification of adenosine 37 of tRNAs whose anticodon begins with U (Fig. 6).

5 In these organisms the enzyme has been shown to use dimethylallyldiphosphate as a donor to generate dimethylallyl-adenosine ($\text{dma}^6\text{A37}$), one base 3' to the anticodon (for review and biochemical characterization of the bacterial enzyme see Persson *et al.*, *Biochimie*
10 **76**: 1152-1160 (1994); Leung *et al.*, *J Biol Chem* **272**: 13073-13083 (1997); Moore and Poulter, *Biochemistry* **36**:604-614 (1997)). In earlier literature this modification is often referred to as isopentenyl adenosine ($\text{i}^6\text{A37}$).

15 The high degree of conservation of the protein sequence between GRO-1 and DMAPP in *S. cerevisiae* and *E. coli* suggest that GRO-1 possesses the same enzymatic activity as the previously characterized genes. The sequence contains a number of conserved structural
20 motifs (Fig. 5), including a region with an ATP/GTP binding motif which is generally referred to as the 'A' consensus sequence (Walker *et al.*, *EMBO J* **1**: 945-951 (1982)) or the 'P-loop' (Saraste *et al.*, *Trends Biochem Sci* **15**: 430-434 (1990)).

25 In addition, at the C-terminal end of the GRO-1 sequence, there is a C2H2 zinc finger motif as defined by the PROSITE database. This type of DNA-binding motif is believed to bind nucleic acids (Klug and Rhodes, *Trends Biochem Sci* **12**: 464-469 (1987)).
30 Although there appears to be some conservation between the worm and yeast sequences in the C-terminus end of the protein (Fig. 5), including in the region encompassing the zinc finger in GRO-1, the zinc finger motif per se is not conserved in yeast but is present in
35 humans (Fig. 9).

In yeast DMAPP transferase is the product of the *MOD5* gene, and exists in two forms: one form which is targeted principally to the mitochondria, and one form which is found in the cytoplasm and nucleus. These two forms differ only by a short N-terminal sequence whose presence or absence is determined by differential translation initiation at two "in frame" ATG codons. (Gillman et al., *Mol & Cell Biol* 11: 2382-90 (1991)). The *gro-1* open reading frame also contains two ATG codons at comparable positions, with the coding sequence between the two codons constituting a plausible mitochondrial sorting signal (Figs. 3 and 5). It is likely therefore that DMAPP transferase in worms also exists in two forms, mitochondrial and cytoplasmic.

It should be noted, however, that the sequence of *hgro-1* shows only one in-frame methionine before the conserved ATP/GTP binding site (Fig. 9). As we cannot be assured to have determined the sequence of the full length transcript, it is possible that further 5' sequence might reveal an additional methionine. Alternatively, in humans, the mechanism by which the enzyme is targeted to several compartments might not involved differential translation initiation. In this context, it should be noted that the sorting signals which can be predicted from the sequence of *hgro-1p* are predicted to be highly ambiguous by the prediction program PSORT II. Furthermore, a conceptual translation of the *Drosophila* sequence (AA816785) predicts only one initiator methionine before the ATP/GTP binding site as well as several in-frame stop codons upstream of this start (Fig. 10), suggesting that no additional upstream ATG could serve as translation initiation site. In the figure, stop codons are indicated by stop, methionines are indicated by **Met**, and the conserved ATP/GTP binding site is underlined.

Expression pattern of GRO-1

We have also constructed a reporter gene expressing a fusion protein containing the entire GRO-1 amino acid sequence fused at the C-terminal end to green fluorescent protein (GFP). The promoter of the reporter gene is the sequence upstream of *gop-1* (Figs. 13A-13C), the first gene in the operon (see Fig. 4). The promoter sequence is 306 bp long starting 32 nucleotides upstream of the *gop-1* ATG. It is fused at the exact level upstream of *gro-1* where trans-splicing to SL2 normally occurs.

The genes *gop-2* (Fig. 14) and *gop-3* (Figs. 15A-15B) are also located in the operon (see Fig. 4), the second and third genes in the operon.

We first construct the clone pMQ8 in which *gro-1* is directly under the promoter for the whole operon using the hybrid primers SHP160 (SEQ. ID. NO:38) and SHP159 (SEQ. ID. NO:37) and the flanking primers SHP161 (SEQ. ID. NO:39) and SHP162 (SEQ. ID. NO:40) in sequential reactions each followed by purification of the products and finally cloning into pUC18 (Fig. 11).

Primers SHP151 (SEQ. ID. NO:36) and SHP170 (SEQ. ID. NO:44) were then used to amplify part of the insert in pMQ8 and clone in pPD95.77 (gift from Dr Andrew Fire) which was designed to allow a protein of interest to be transcriptionally fused to Green Fluorescent Protein (GFP) (Fig. 12).

The reporter construct fully rescues the phenotype of a *gro-1(e2400)* mutant upon injection and extrachromosomal array formation, indicating that the fusion to the GFP moiety does not significantly inhibit the function of GRO-1. Fluorescent microscopy indicated that *gro-1* is expressed in most or all somatic cells. Furthermore, the GRO-1::GFP fusion protein is localized

in the mitochondria, in the cytoplasm as well as in the nucleus.

The *hap-1* gene product (Fig. 16)

5 *hap-1* is homologous to the yeast gene *HAM1* as well as to sequences in many organisms including bacteria and mammals (Fig. 7).

The origin of the worm and yeast sequence is as described above and below. The human sequence was inferred from a cDNA sequence assembled from expressed
10 sequence tags (ESTs); the accession numbers of the sequences used were: AA024489, AA024794, AA025334, AA026396, AA026452, AA026502, AA026503, AA026611, AA026723, AA035035, AA035523, AA047591, AA047599, AA056452, AA115232, AA115352, AA129022, AA129023,
15 AA159841, AA160353, AA204926, AA226949, AA227197 and D20115. The *E. coli* sequence is a predicted gene (accession 1723866).

Mutations in *HAM1* increase the sensitivity of yeast to the mutagenic compound 6-N-hydroxylaminopurine
20 (HAP), but do not increase spontaneous mutation frequency (Nostov et al., Yeast 12:17-29 (1996)). HAP is an analog of adenine and *in vitro* experiments suggest that the mechanism of HAP mutagenesis is its conversion to a deoxynucleoside triphosphate which is incorporated
25 ambiguously for dATP and dGTP during DNA replication (Abdul-Masih and Bessman, J Biol Chem 261 (5): 2020-2026 (1986)). The role of the *Ham1p* gene product in increasing sensitivity to HAP remains unclear.

Explaining the pleiotropy of *miaA* and *gro-1*

30 Mutations in *miaA*, the bacterial homologue of *gro-1*, show multiple phenotypes and affect cellular growth in complex ways. For example, in *Salmonella typhimurium*, such mutations result in 1) a decreased efficacy of suppression by some suppressor tRNA, 2) a
35 slowing of ribosomal translation, 3) slow growth under

various nutritional conditions, 4) altered regulation of several amino acid biosynthetic operons, 5) sensitivity to chemical oxidants and 6) temperature sensitivity for aerobic growth (Ericson and Björk, *J. Bacteriol.* **166**: 1013-1021 (1986); Blum, *J. Bacteriol.* **170**: 5125-5133 (1988)). Thus, MiaAp appears to be important in the regulation of multiple parallel processes of cellular physiology. Although we have not yet explored the cellular physiology of *gro-1* mutants along the lines which have been pursued in bacteria, the apparently central role of *miaA* is consistent with our findings that *gro-1*, and the other genes with a Clk phenotype, regulate many disparate physiological and metabolic processes in *C. elegans* (Wong et al., *Genetics* **139**: 1247-1259 (1995) ; Lakowski and Hekimi, *Science* **272**: 1010-1013 (1996); Ewbank et al., *Science* **275**: 980-983 (1997)).

In addition to the various phenotypes discussed above, *miaA* mutations increase the frequency of spontaneous mutations (Connolly and Winkler, *J Bacteriol* **173**(5): 1711-21 (1991); Connolly and Winkler, *J Bacteriol* **171**: 3233-46 (1989)). As described in the previous section we have preliminary evidence that *gro-1*(*e2400*) also increases the frequency of spontaneous mutations in worms.

How can the alteration in the function of MDAPP transferase result in so many distinct phenotypes? Bacterial geneticists working with *miaA* have generally suggested that this enzyme and the tRNA modification it catalyzes have a regulatory function which is mediated through attenuation (e.g. Ericson and Björk, *J. Bacteriol.* **166**: 1013-1021 (1986)). Attenuation is a phenomenon by which the transcription of a gene is interrupted depending on the rate at which ribosomes can translate the nascent transcript. Ribosomal transla-

tion is slowed in *miaA* mutants, and thus, through an effect on attenuation, could affect the expression of many genes whose expression is regulated by attenuation.

5 *gro-1(e2400)* also produces pleiotropic effects and, in addition, displays a maternal-effect, suggesting that it is involved in a regulatory process (Wong et al., *Genetics* 139: 1247-1259 (1995). However, attenuation involves the co-transcriptional translation
10 of nascent transcripts, which is not possible in eukaryotic cells where transcription and translation are spatially separated by the nuclear membrane. If the basis of the pleiotropy in *miaA* and *gro-1* is the same, then a mechanism distinct from attenuation has to be
15 involved. Below we argue that this mechanism could be the modification by DMAPP transferase of adenine residues in DNA in addition to modification of tRNAs.

A role for *gro-1* in DNA modification?

We observed that *gro-1* can be rescued by a
20 maternal effect, so that adult worms homozygous for the mutation, but issued from mother carrying one wild type copy of the gene display a wild type phenotype, in spite of the fact that such adults are up to 1000 fold larger than the egg produced by their mother. It is
25 unlikely that enough wild type product can be deposited by the mother in the egg to rescue a adult which is 1000 times larger. This observation suggests therefore that *gro-1* can induce an epigenetic state which is not altered by subsequent somatic growth. One of the best
30 documented epigenetic mechanisms is imprinting in mammals (Lalande, *Annu Rev Genet* 30: 173-196 (1996)) which is believed to rely on the differential methylation of genes (Laird and Jaenisch, *Annu Rev Genet* 30: 441-464; Klein and Costa, *Mutat Res* 386: 103-105 (1997)).
35 Modification of bases in DNA have also been linked to regu-

lation of gene expression in the protozoan *Trypanosoma brucei*. The presence of beta-D-glucosyl-hydroxymethyluracil in the long telomeric repeats of *T. brucei* correlates with the repression of surface antigen gene expression (Gommers-Ampt et al., *Cell* 75: 112-1136 (1993); van Leeuwen et al., *Nucleic Acids Res* 24: 2476-2482 (1996)).

gro-1 and *miaA* increase the rate of spontaneous mutations, which is generally suggestive of a role in DNA metabolism, and can be related to the observation that methylation is linked to spontaneous mutagenesis, genome instability, and cancer (Jones and Gonzalzo, *Proc. Natl. Acad. Sci. USA*, 94: 2103-2105 (1997)).

Does *gro-1* have access to DNA? Studies with *mod5*, the yeast homologue of *gro-1*, have shown that there are two forms of Mod5p, one is localized to the nucleus as well as to the cytoplasm, and the other form is localized to the mitochondria as well as the cytoplasm (Boguta et al., *Mol. Cell. Biol.* 14: 2298-2306 (1994)). The nuclear localization is striking as isopentenylation of nuclear-encoded tRNA is believed to occur exclusively in the cytoplasm (reviewed in Boguta et al., *Mol. Cell. Biol.* 14: 2298-2306 (1994)). Furthermore, studies of a gene *mafl* have shown that when *mod5* is mislocalized to the nucleus, the efficiency of certain suppressor tRNA is decreased, an effect known to be linked to the absence of the tRNA modification (Murawski et al., *Acta Biochim. Pol.* 41: 441-448 (1994)). Finally, as described in the previous section, *gro-1* contains a zinc finger, a nuclei acid binding motif. The zinc finger could bind tRNAs, but as it is in the C-terminal domain of *gro-1* and human hgro-1 that has no equivalent in *miaA*, it is clearly not necessary for the basic enzymatic function. We speculate that it might be necessary to increase the

specificity of DNA binding in the large metazoan genome. It should also be noticed that the second form of Mod5p which is localized to mitochondria also has the opportunity to bind and possibly modify DNA as it
5 has access to the mitochondrial genome. See the previous section entitled "A role for *gro-1* in a central mechanism of physiological coordination" for an alternative possibility as to the function of GRO-1 in the nucleus.

10 *miaA* and *gro-1* are found in complex operons

We have found that *gro-1* is part of a complex operon of five genes (Fig. 4). It is believed that genes are regulated coordinately by single promoters when they participate in a common function (Spieth et
15 al., *Cell* 73: 521-532 (1993)). In some cases, this is well documented. For example, the proteins LIN-15A and LIN-15B which are both required for vulva formation in *C. elegans*, are unrelated products from two genes transcribed in a common operon (Huang et al., *Mol Biol Cell*
20 5(4): 395-411 (1994)). One of the genes in the *gro-1* promoter is *hap-1*, whose yeast homologue has been shown to be involved in the control of mutagenesis (Nostov et al., *Yeast* 12: 17-29 (1996)). Under the hypothesis that *gro-1* modifies DNA, it suggest an involvement of
25 *hap-1* in this or similar processes. The presence in the same operon also suggest that all five genes might collaborate in a common function. The phenotype of *gro-1* suggests that this function is regulatory. In this context, it should be noted that *miaA* also is part
30 of a particularly complex operon (Tsui and Winkler, *Biochimie* 76: 1168-1177 (1994)), although, except for *miaA/gro-1*, there are no other homologous genes in the two operons.

A role for *gro-1* in a central mechanism of physiological coordination

We have speculated that the genes with a Clk phenotype might participate in a central mechanism of physiological coordination, probably including the regulation of energy metabolism. *clk-1* encodes a mitochondrial protein (unpublished observations), and its homologue in yeast has also been shown to be mitochondrial (Jonassen, T (1998) *Journal of Biological Chemistry* 273:3351-3357). The yeast *clk-1* homologue is involved in the regulation of the biosynthesis of ubiquinone (Marbois, B.N. and Clarke, C.F. (1996) *Journal of Biological Chemistry* 271:2995-3004). Ubiquinone, also called coenzyme Q, is central to the production of ATP in mitochondria. In worms, however, we have found that *clk-1* is not strictly required for respiration. How might *gro-1* fit into this picture?

One link is that dimethylallyldiphosphate is known to be the precursor of the lipid side-chain of ubiquinone. In bacteria, ubiquinone is the major lipid made from DMAPP. In eukaryotes cholesterol and its derivatives are also made from DMAPP. Interestingly, *C. elegans* requires cholesterol in the growth medium for optimal growth. This link, however, remains tenuous, in particular in the absence of an understanding of the biochemical function of CLK-1.

In several bacteria, the adenosine modification carried out by DMAPP transferase is only the first step in a series of further modification of this base (Persson et al., *Biochimie* 76: 1152-1160 (1994)). These additional modifications have been proposed to play the role of a sensor for the metabolic state of the cell (Buck and Ames, *Cell* 36: 523-531 (1984); Persson and Björk, *J. Bacteriol.* 175: 7776-7785 (1993)). For example, one of the subsequent steps, the synthesis of 2-methylthio-cis-ribozeatin is carried

out by a hydroxylase encoded by the gene *miaE*. When the cells lack *miaE* they become incapable of using intermediates of the citric acid cycle such as fumarate and malate as the sole carbon source.

5 Another link to energy metabolism springs from the recent biochemical observations of Winkler and co-workers using purified DMAPP transferase (*E. coli* MiaAp) (Leung et al., *J Biol Chem* 272: 13073-13083 (1997)). These investigators observed that the enzyme
10 in competitively inhibited by phosphate nucleotides such as ATP or GTP. Furthermore, using their estimation of K_m of the enzyme and its concentration in the cell, they calculate that the level of inhibition of the enzyme *in vivo*, would exactly allow the enzyme to mod-
15 ify all tRNAs but any further inhibition would leave unmodified tRNAs. This suggests that the exact level of modification of tRNA (or of DNA) could be exquisitely sensitive to the level of phosphate nucleotides. Superficially, this is consistent with the phenotypic
20 observations. The state of mutant cells which lack DMAPP transferase entirely would be equivalent of cells where very high levels of ATP would completely inhibit the enzyme. Such cells might therefore turn down the ATP generating processes in response to the signal pro-
25 vided by undermodified tRNAs (or DNA).

More generally, GRO-1 could act in the crosstalk between nuclear and mitochondrial genomes. The nuclear and mitochondrial genomes both contribute gene products to the mitochondrion energy-producing machinery and
30 these physically separate genomes must therefore exchange information somehow to coordinate their contributions (reviewed in Poyton, R.O. and McEwen J.E. (1996) *Annu. Rev. Biochem.* 65:563-607). Furthermore, the energy producing activity of the mitochondria is
35 essential to the rest of the cell, and the needs of a

particular cell at a particular time must be somehow convey to the organelle to regulate its activity. GRO-1 could participate in this coordination in the following manner. GRO-1 is found in three compartments, the
5 nucleus, the cytoplasm and the mitochondria (see above), and thus has the opportunity to regulate gene expression in more that one way. How could its action coordinate gene expression between compartment? GRO-1 could partition between the mitochondria and the
10 nucleus and its relative distribution could be determined by the amount of RNA (or mtDNA) in the mitochondria (Parikh, V.S. et al. (1987) *Science* 235:576-580). For example, if the cell is rich in mitochondria, much GRO-1 will be bound there which
15 could result in a relative depletion of activity in the cytoplasm with regulatory consequences on the translation machinery. Binding of GRO-1 in the nucleus could have similar consequences and provide information about nuclear gene expression to the translation
20 machinery.

While the invention has been described in connection with specific embodiments thereof, it will be understood that it is capable of further modifications and this application is intended to cover any varia-
25 tions, uses, or adaptations of the invention following, in general, the principles of the invention and including such departures from the present disclosure as come within known or customary practice within the art to which the invention pertains and as may be
30 applied to the essential features hereinbefore set forth, and as follows in the scope of the appended claims.

WHAT IS CLAIMED IS:

1. A *gro-1* gene which has a function at the level of cellular physiology involved in developmental rate and longevity, wherein *gro-1* is located within an operon and *gro-1* mutants have a longer life and a altered cellular metabolism relative to the wild-type.
2. The *gro-1* gene of claim 1, wherein said operon has the nucleotide sequence set forth in SEQ ID. NO:1.
3. The *gro-1* gene of claim 1, which codes for a GRO-1 protein having the amino acid sequence set forth in Figs. 3A-3B (SEQ ID. NO:2).
4. A *gop-1* gene which codes for a GOP-1 protein having the amino acid sequence set forth in Figs. 13A-13C (SEQ ID. NO:4).
5. A *gop-2* gene which codes for a GOP-2 protein having the amino acid sequence set forth in Fig. 14 (SEQ ID. NO:5).
6. A *gop-3* gene which codes for a GOP-3 protein having the amino acid sequence set forth in Figs. 15A-15B (SEQ ID. NO:6).
7. A *hap-1* gene which codes for a HAP-1 protein having the amino acid sequence set forth in Fig. 16 (SEQ ID. NO:7).
8. The *gro-1* gene of claim 1, wherein said gene is of human origin and which has the nucleotide sequence set forth in Fig. 8 (SEQ ID. NO:3).

9. A GRO-1 protein which has a function at the level of cellular physiology involved in developmental rate and longevity, wherein said GRO-1 protein is encoded by the gene of claim 1 or 2.

10. A mutant GRO-1 protein which has the amino acid sequence set forth in Fig. 3C.

11. A GRO-1 protein which has the amino acid sequence set forth in Figs. 3A-3B (SEQ ID. NO:2).

12. A GOP-1 protein which has the amino acid sequence set forth in Figs. 13A-13C (SEQ ID. NO:4).

13. A GOP-2 protein which has the amino acid sequence set forth in Fig. 14 (SEQ ID. NO:5).

14. A GOP-3 protein which has the amino acid sequence set forth in Figs. 15A-15B (SEQ ID. NO:6).

15. A HAP-1 protein which has the amino acid sequence set forth in Fig. 16 (SEQ ID. NO:7).

16. A method for the diagnosis and/or prognosis of cancer in a patient, which comprises the steps of:

- a) obtaining a tissue sample from said patient;
- b) analyzing DNA of the obtained tissue sample of step a) to determine if the human *gro-1* gene is altered, wherein alteration of the human *gro-1* gene is indicative of cancer.

17. A mouse model of aging and cancer, which comprises a gene knock-out of murine gene homologous to *gro-1* gene of claims 1 to 3.

18. The use of compounds interfering with enzymatic activity of GRO-1 of claim 9, 10 or 11 for enhancing longevity of a host.

19. The use of compounds interfering with enzymatic activity of GOP-1 of claim 12 for enhancing longevity of a host.

20. The use of compounds interfering with enzymatic activity of GOP-2 of claim 13 for enhancing longevity of a host.

21. The use of compounds interfering with enzymatic activity of GOP-3 of claim 14 for enhancing longevity of a host.

22. The use of compounds interfering with enzymatic activity of HAP-1 of claim 15 for enhancing longevity of a host.

23. The use of compounds interfering with enzymatic activity of GRO-1 of claim 9, 10 or 11 for inhibiting tumorous growth.

24. The use of compounds interfering with enzymatic activity of GOP-1 of claim 12 for inhibiting tumorous growth.

25. The use of compounds interfering with enzymatic activity of GOP-2 of claim 13 for inhibiting tumorous growth.

26. The use of compounds interfering with enzymatic activity of GOP-3 of claim 14 for inhibiting tumorous

growth.

27. The use of compounds interfering with enzymatic activity of HAP-1 of claim 15 for inhibiting tumorous growth.

(1) GENERAL INFORMATION:

- (i) APPLICANT: MCGILL UNIVERSITY
- (ii) TITLE OF INVENTION: THE C. ELEGANS gro-1 GENE
- (iii) NUMBER OF SEQUENCES: 62
- (iv) CORRESPONDENCE ADDRESS:
 - (A) ADDRESSEE: SWABEY OGILVY RENAULT
 - (B) STREET: 1981 McGill College Avenue - Suite 1600
 - (C) CITY: Montréal
 - (D) STATE: QC
 - (E) COUNTRY: Canada
 - (F) ZIP: H3A 2Y3
- (v) COMPUTER READABLE FORM:
 - (A) MEDIUM TYPE: Diskette
 - (B) COMPUTER: IBM Compatible
 - (C) OPERATING SYSTEM: Windows
 - (D) SOFTWARE: FastSEQ for Windows Version 2.0b
- (vi) CURRENT APPLICATION DATA:
 - (A) APPLICATION NUMBER:
 - (B) FILING DATE:
 - (C) CLASSIFICATION:
- (vii) PRIOR APPLICATION DATA:
 - (A) APPLICATION NUMBER: CA 2,210,251
 - (B) FILING DATE: 25-AUG-1997
- (viii) ATTORNEY/AGENT INFORMATION:
 - (A) NAME: Côté, France
 - (B) REGISTRATION NUMBER: 4166
 - (C) REFERENCE/DOCKET NUMBER: 1770-179PCT FC/ld
- (ix) TELECOMMUNICATION INFORMATION:
 - (A) TELEPHONE: 514 845-7126
 - (B) TELEFAX: 514 288-8389
 - (C) TELEX:

(2) INFORMATION FOR SEQ ID NO:1:

- (i) SEQUENCE CHARACTERISTICS:
 - (A) LENGTH: 14458 base pairs
 - (B) TYPE: nucleic acid
 - (C) STRANDEDNESS: single
 - (D) TOPOLOGY: linear
- (ii) MOLECULE TYPE: Genomic DNA
- (xi) SEQUENCE DESCRIPTION: SEQ ID NO:1:

INTERNATIONAL SEARCH REPORT

International Application No
PCT/CA 98/00803

A. CLASSIFICATION OF SUBJECT MATTER
IPC 6 C12N9/10 C12Q1/68 A01K67/027 //C12N15/62

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 C12N C12Q A01K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	WILSON R ET AL: "2.2 MB OF CONTIGUOUS NUCLEOTIDE SEQUENCE FROM CHROMOSOME III OF C ELEGANS" NATURE, vol. 368, no. 6466, 3 March 1994, pages 32-38, XP002029739	1-7, 9, 11-15
Y	see the whole document -& DATABASE EMBL - CEZC395 Entry CEZC395, Acc.No. U13642, 30 November 1994 WILSON, R. ET AL.: "Caenorhabditis elegans cosmid C34E10"	8
-/--		

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

Date of the actual completion of the international search

11 January 1999

Date of mailing of the international search report

22/01/1999

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2

INTERNATIONAL SEARCH REPORT

International application No.

PCT/CA 98/00803

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
SEE FURTHER INFORMATION SHEET PCT/ISA/210
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Although claims 18-27 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

The claims 18-27, referring to compounds interfering with the enzymatic activity of the claimed proteins, could not be searched completely due to the lack of support of these compounds in the application.
